Demo Summary

Our program is a purchase guiding program on iOS. In last month our group has implement most of the features.

The features we already achieve.

1.The Search page can let users input or select the specifications which they need. Our database have almost hundred of data to be sort.

2.After user search the specifications they chose, the result will be outputted on the result list page. On this page users can see the result on one page. The list is able to be outstretch to the end of the list. Each column of the result can be sort by tapping the title of the specifications.

3. At the end of each row in the list, there is a compare button which can add the current device into the compare list. When you add two devices into the list, user can tap the button on the bottom UI. Turn into the compare page. On this page users are able to compare all the details about that device.

The features that will come soon.

1. The detail page that can show all the specifications for each devices from the database will be our next step.

2. The helper page that show on the top left corner, which should teach the new users how to use this program. We are still discussing the structure of this page.

3. The compare page will have more abilities. Such as, highlight the lower price and higher ram and capacity. We are going to improve this part to be easy and fast for users.

Status report

Right now we are almost done the program. We can finish the detail and helper pages when we complete the database. The abilities that will be added into the compare page will be discussed as our final goal. When we decide which kinds of abilities that can be added into the program. Then we will fix and improve the UI for our program.

In this month we will finish above purposes and see if there any features that we can use in our program. We hope we can finish this app in the last of this month.
